## General Description

\_\_\_\_\_

This folder contains programs for encryption of message using three types of ciphers

- 1. Permutation
- 2. Vigenere
- 3. Enigma

The  $\star.py$  programs with the names of the ciphers are the corresponding programs. All of

these programs take input from a file named input.txt and write the cipher in output.txt.

To get cipher without spaces(Part 2 of assignment) change the second argument of the call to formatInput to 0.(For permutation.py it should be formatInput(myMessage, 0, 1, myKey))

fileHandler.py is to handle file I/O. formatInput.py is to format the input text message as needed.

## How To Run

\_\_\_\_\_

1. From Command Prompt: python <filename.py>

Ex: python permutation.py

2. Using IDLE GUI: Press F5
